BLOOMSKY.COM/CONTACT

2.4 GHz: Check your Wi-Fi router. If your router only offers 802.11 a/b/g, you will be able to connect your device. If your router offers 802.11n, you may be running your router on a 50Hz frequency. If so, check your Wi-Fi network name. If the network offered by your router does not contain the phrase 50 at the end of the title, you are probably running on a 2.4 GHz connection. If you have 802.11 ac, we sincerely apologize but your devices currently do not support 5 GHz connections.

● OUTDOOR DEVICE SETUP INSTRUCTIONS

- 1 Connect your smartphone or tablet to your 2.4 GHz Wi-Fi network.
- 2 With your phone or tablet, stay within a 5 feet range of the router during the set up to ensure good signal strength between the devices.
- 3 Launch the BloomSky app. Log into the account you intend to use to set up the device and initiate the "add device" process. Follow the in-app directions.

- 4 Go outside and set up the BloomSky Device! It will take around 3 minutes for your app to give you its first weather report.

Note: The BloomSky's camera is only active during the day and sleeps during the night to conserve power.
