Short Description

Chrome Sputnik Barometer 20cm

Description

The barometer was invented back in the 17th century for laboratory use, and since then has become a popular household item. The Sputnik barometer is a truly beautiful shape. Based on the first satellite to be launched in to space, it is a neat, table-standing unit, designed to really draw the eye.

Although protected by glass, the metal dial is totally exposed. There is a temperature and humidity dial respectively.

This barometer is shipped from us in safe transportation mode, and will arrive to you unset. This is so that the needle does not move in transit, and therefore become damaged. On arrival, the barometer needs to be manually set to your local air pressure, which you can find online from various resources. This process is very simple, and can be done by simply turning a screw on the back to make the needle move to the required position. Once the barometer is set, it is ready for use.

Increasing pressure indicates that the weather will be getting better with more warmer and dryer conditions.

Decreasing pressure indicates that the weather is set to worsen - with cloudy days and rainfall. Quick drops in pressure can signify that a storm is imminent in the next several hours.

Additional Information

Brand	TFA Dostmann
Barometer Style	Modern
Barometers Designed for	Indoor
Material	Metal
