

Brass Barometer with Open Movement -14cm diameter

Product Images

Short Description

- Made in Germany
- Barometer in maritime design
- Made of polished brass
- Visible barometer movement to forecast the weather.

Description

Made of polished brass in a classic maritime design, the visible movement allows you to look at the high-quality mechanism of the aneroid barometer. The measurement of the air pressure makes a local weather forecast possible. Whilst the weather improves with increasing air pressure, you should expect bad weather with decreasing air pressure.

The barometer is entirely manufactured in Germany.

The gold trimmed barometric pressure dial has a beautiful white face, with an intricate open movement dial, and delicately crafted hand.

This barometer is shipped from us in safe transportation mode, and will arrive to you unset. This is so that the needle does not move in transit, and therefore become damaged. On arrival, the barometer needs to be manually set to your local air pressure, which you can find online from various resources. This process is very simple, and can be done by simply turning a screw on the back to make the needle move to the required position. Once the barometer is set, it is ready for use.

Increasing pressure indicates that the weather will be getting better with more warmer and dryer conditions. Decreasing pressure indicates that the weather is set to worsen - with cloudy days and rainfall. Quick drops in pressure can signify that a storm is imminent in the next several hours.

Additional Information

Brand	TFA Dostmann
Barometer Style	Traditional
Barometers Designed for	Indoor
Material	Brass
